IN REPLY REFER TO: WESYV

31 August 1978

SUBJECT: Transmittal of Miscellaneous Paper D-78-1

TO: All Report Recipients

1. The Miscellaneous Paper transmitted herewith represents the results of one of the research efforts (work units) of the Corps of Engineers' Dredged Material Research Program (DMRP). This study was conducted by the Habitat Development Project (HDP) of the DMRP. The HDP had as its main objectives the development of wetland and upland habitats on dredged material and the evaluation of the impact of disposal in shallow water and upland sites.
2. This report, "A Survey of Potential Medical and Veterinary Diseases at Habitat Development Field Sites" (Work Unit 2A10), addresses the concern that the establishment of natural habitats on dredged material may increase the incidence of medical or veterinary diseases at those sites. Habitat development sites in Oregon, Texas, and Virginia were evaluated, and it was found that an increase in the incidence of vector-borne, contact, or environmental diseases would not be expected as a result of habitat development activities.
3. This work unit is of importance in assessing the overall environmental impact of the habitat development disposal alternative and is one of many research efforts in the HDP with a similar objective. This and related work units will be synthesized in a report entitled "Upland and Wetland Habitat Development with Dredged Material: Ecological Considerations" (2A08).

Preface

This report constitutes a literature survey of selected potential medical and veterinary diseases at three of the Dredged Material Research Program (DMRP), Habitat Development Project (HDP) field sites: Miller Sands Marsh and Upland Habitat Development Site, Columbia River, Oregon; Bolivar Peninsula Marsh and Upland Habitat Development Site, Galveston Bay, Texas; and Windmill Point Marsh Development Site, James River, Virginia.

The study was conducted as Work Unit 2A10 of the DMRP for the Office, Chief of Engineers, at the U. S. Army Engineer Waterways Experiment Station (WES), Environmental Laboratory (EL), formerly the Environmental Effects Laboratory, Vicksburg, Mississippi.

The report was written by Dr. John W. Simmers, HDP. The study was under the supervision of Dr. Hanley K. Smith, Manager, HDP, and the general supervision of Dr. John Harrison, Chief, EL.

The Directors of WES during the study were COL G. H. Hilt, CE, and COL J. L. Cannon, CE. Technical Director was Mr. F. R. Brown.

A SURVEY OF POTENTIAL MEDICAL AND
VETERINARY DISEASES AT HABITAT
DEVELOPMENT FIELD SITES

Introduction

1. The development of marsh and upland habitats from dredged material disposal sites at Bolivar Peninsula, Galveston Bay, Galveston County, Texas; Windmill Point, James River, Prince Georges County, Virginia; and Miller Sands, Columbia River, Clatsop County, Oregon, may affect the localized incidence of selected human and veterinary diseases in these areas. The effect could be an indirect impact of habitat development through the attraction and maintenance of animal populations that serve either as reservoirs or are otherwise involved in the maintenance or transmission of communicable diseases of human or veterinary importance.

2. This report represents an effort to distinguish between the possibility for a communicable disease problem related to habitat development and the probability of a problem related to this activity.

Survey Approach

3. This survey was conducted in three phases; the first phase involved the listing of animal species (both fish and wildlife) associated with the particular habitat development sites. The second phase identified known diseases of human or veterinary importance potentially associated with each animal on the list and the role that the animal fills in the transmission of the disease. For example, a red-winged blackbird (*Agelaius phoeniceus*) can be a reservoir for the virus of western equine encephalitis. If in fact the blackbird were infected with the virus, the disease could be carried to a man or a horse or to other animals by certain species of mosquitoes (*Aedes aegypti* or various *Culex* spp.) which first bite the blackbird and then bite the man. As the reader might judge for himself, the variety of possible diseases a man exposes himself

to through association with natural animal communities is surprising and perhaps upsetting but the actual occurrences of these diseases on the local and state level do not approach the potential. The third phase served then to define, for each disease, the actual localized and statewide occurrence of the diseases listed.

Animal populations at the habitat development sites

4. The list of fauna presented in this report and used to define potential disease interactions was obtained from the Dredged Material Research Program (DMRP), Habitat Development Project (HDP) files and represents two types of information:

- a. Listings from baseline field and/or literature faunal inventories for the general locations of proposed habitat development.
- b. Listings of fish and wildlife species actually observed at the sites during the early phases of site development.

5. The faunal listings presented are incomplete for the locations discussed but are suggested as adequate for the purpose of defining the relationships that may cause the transmission of disease from animal to animal or animal to man.

Potential disease problems

6. The potential diseases associated with the listed fish and wildlife were identified from reports of state health organizations of Washington, Texas, and Virginia; publications of the U. S. Center for Disease Control; publications of the U. S. Agricultural Research Service; and a general literature review.

Actual disease occurrences

7. The 4-year period from 1971-1975 was studied to identify the actual incidence of the various diseases in the states and in counties adjacent to the locations of the HDP field sites. The same sources used to obtain potential disease information were used to obtain the actual disease incidence data.

Results

Survey

8. The results of the survey are presented in Tables 1-3 according to column headings that are explained below. Tables are designed

for quick reference by site and obvious animal species. Diseases listed are those that may be influenced by habitat management practices to encourage or discourage site use by specific animals. Although these diseases may have been reported from areas near the HDP field sites, none have been reported specifically from the field sites. Finally in order to make the tabulation less confusing, literature references have been omitted and a list of useful secondary literature is given in the bibliography.

Definitions and explanations
of column headings within tables

10. The following is an explanation of the headings included in the tables:

- a. Host -- An abundant animal at the site and one that might maintain a pathogen (bacteria, virus, etc.) by serving as a reservoir for that pathogen. The host animal may also transfer a pathogen to man or to animals of economic importance to man. When the host animal serves the transfer function, it is called a vector. Host animals are usually vertebrates and the most obvious animals at each field site.
- b. Vector or intermediate host -- Certain diseases are directly communicated from one man or animal to another man or animal but most listed in the tables of this report require another animal to link the reservoir and the susceptible host. This other animal is either a vector or an intermediate host or both.
 - (1) Vector -- A micropredator (a predator that takes only a small bit of nourishment from the prey) that may transfer a pathogen from one susceptible host (reservoir) to another susceptible host. If the pathogen does not further develop or reproduce in the micropredator, then the micropredator is called a vector; if the pathogen develops or reproduces in the micropredator, the micropredator is considered an intermediate host. Usually vectors seek out prey (susceptible hosts) and may transfer pathogens to new host species and new geographical areas.
 - (2) Intermediate host -- As explained above, the intermediate host may be a vector. The intermediate host may also serve a passive role in disease communication. An animal serving as an intermediate host may be eaten by a susceptible host thereby transferring the pathogen to the susceptible host. A waterborne pathogen may undergo development or reproduction in an intermediate host before returning to the water to infect a

susceptible host. Intermediate hosts are most often lower invertebrates: arthropods (usually insects) and mulluscs (snails or bivalvia).

- c. Disease -- May be acute or chronic and generally one of three types: vector-borne diseases, contact diseases, or environmental diseases. For information on most of these diseases, the reader is directed to the Manual of Communicable Diseases, published by the Communicable Disease Center, Atlanta, Georgia.
- d. Role of host in disease -- A host animal may serve one or more roles in the communication of human or veterinary disease.
 - (1) Final susceptible host -- Contains the final development form of the pathogen, usually the infectious form.
 - (2) Host of micropredators -- An animal supporting micropredators that may serve as vectors or intermediate hosts, e.g., an animal serving as a tick host or flea host.
 - (3) Intermediate host -- This role is explained above and refers to a host supporting a developing or reproducing stage of a pathogen.
 - (4) Reservoir host -- An animal that harbors a pathogen at a chronic level and thereby makes the pathogen available to vectors, intermediate hosts, or final hosts.
- e. Pathogen -- A living organism such as a virus, bacteria, protozoa, etc., capable of producing disease in a susceptible host.
- f. Hosts of economic significance -- Hosts including man that are preferred by micropredatory vectors, or who may consume intermediate hosts or who are otherways susceptible to a disease. Included in this list with man are animals associated with man as domestic animals or pets.
- g. Human infections per year -- The average number of infections reported for 1971-1975 from counties adjacent to the HDP field site.
- h. Average for state -- The average number of human infections reported for 1971-1975 from the entire adjacent state.
- i. Likelihood of occurrence -- An a through d rating of possible occurrence of each disease at each site:
 - (1) a Reported in county or adjacent counties every year 1971-1975.
 - (2) b Reported in the state during 1971-1975, but no cases in counties adjacent to HDP field site.

- (3) c Reservoir, vector, and/or intermediate host species present, but no cases reported in man.
- (4) d Veterinary disease predominantly of wildlife, no human cases.

j. Notes -- A series of notes is appended to each table set to clarify or elaborate on items of special importance.

Table 1: Notes, Miller Sandis

1. These diseases are related to water temperature; water temperature should not be increased.
2. A rickettsial disease carried by a fluke in a fish.
3. An average of seven cases per year of rabies in wild animals occurs in the state.
4. There are no significant medical or veterinary diseases currently known to be related to nutria.
5. Avian botulism can be exceptionally harmful to populations of waterfowl during periods of drought.
6. Leucocytozoonosis may be fatal to immature waterfowl.
7. Undoubtedly there are many infected birds. This is a common disease, but only occasionally reported.

Table 2 (Concluded)

Host	Vector or Intermediate Host	Disease	Role of Host in Disease	Reservoir	Pathogen	Hosts of Economic Significance	Human Infections per Year	Average State for Year	Average Likelihood of Occurrence	Notes
<u>Mutilla</u> <u>seychellensis</u>	None	Salmonellosis			<u>Salmonella</u> <u>typhimurium</u>	Man	?	1042	a	11
Striped mullet										
<u>Trachinotus</u> <u>carolinus</u>	None									11
Pompano										
<u>Brevoortia</u> <u>patronus</u>	None	Coccidiosis	Host		<u>Brevoortia</u> <u>brevoortiae</u>	Menhaden	0	0	d	
Gulf menhaden										
<u>Callionymus</u> <u>reticulatus</u>	None	Food poisoning	Reservoir		<u>Vibrio</u> <u>parahaemolyticus</u>	Man	?	?	c	11
Blue crab										
<u>Penaeus</u> <u>setiferus</u>	None									11
Brown shrimp										
<u>Penaeus</u> <u>notatus</u>	None									
White shrimp										

Table 2: Notes, Bolivar Peninsula

1. Nearby Brazoria County, Texas, has been the only recent site of tick surveillance.
2. Chagas' disease or American trypanosomiasis is a potential threat. All the vectors and reservoir hosts are present, but human cases are rare in the U. S.
3. Leprosy incidence has dropped from 3^{1/4} in 1972 to 17 in 1975. Involvement of armadillo is not well defined at this time.
4. A high proportion of reported cases occurred in counties adjacent to the HDP field site.
5. Thirty-three St. Louis encephalitis cases were reported in Harris County in 1975. Only Jefferson County, Texas, participated in the 1976 surveillance program. Harrison and Jefferson Counties are near the Bolivar Peninsula.
6. This disease is usually not reported by health organizations.
7. Plague has not been reported in the 1971-1975 period, but was reported in the 1900-1970 period.
8. No reports by county are available.
9. A total of 330 veterinary rabies cases have been reported per year statewide.
10. A. fever has not been reported from this area, but vectors are present.
11. Local food poisoning reports and salmonellosis reports are not available. Packaging and transport of food moves contaminated material out of the immediate area of contamination.

Table 3
Potential Medical and Veterinary Diseases at Minimill Point

Host	Vector or Intermediate Host	Disease	Role of Host in Disease	Pathogen	Economic Significance	Human Infection Per Year	Average State for Occurrence	Likelihood of Human Infection
<i>Chortarivus voriferus</i> Killdeer	<i>Culicoides pipiens</i>	Western equine encephalitis Eastern equine encephalitis St. Louis encephalitis	Reservoir	Virus	Man, horse, domestic bird, passerine bird, rodent	0	0	0
<i>Arenatus phoeniceus</i> Red-winged blackbird	<i>Peromyscus variabilis</i>	Rocky Mtn. spotted fever Tularemia	Tick host	<i>Babesia rickettsii</i> <i>Pathococci laemmeli</i> <i>Anaplasma marginale</i> <i>Coxiella burnetii</i> None	Man, dog, rabbit, rodent, passerine bird	<1	0	1
<i>Haemaphysalis leporis-tularensis</i>		Rocky Mtn. spotted fever Tularemia	Reservoir	<i>Rickettsia rickettsii</i> <i>Pathococci laemmeli</i>	Man, rabbit, rodent, passerine bird	Not reported	0	4
<i>Amblyomma maculatum</i>		Rocky Mtn. spotted fever	Reservoir	<i>Rickettsia rickettsii</i>	Man, rabbit, dog, rodent, passerine bird	<1	77	3
<i>Culicoides pipiens</i>		Western equine encephalitis Eastern equine encephalitis St. Louis encephalitis Avian malaria	Reservoir	Virus	Man, horse, domestic bird, passerine bird, rodent	0	0	0
<i>Forcipomyia acutipennis</i> Gnat	<i>Acalymma acutipennis</i>	Rocky Mtn. spotted fever Tularemia	Tick host	<i>Babesia rickettsii</i> <i>Babesia microti</i> <i>Babesia microti</i> None	Man, rabbit, rodent, passerine bird	<1	0	1
<i>Onthophagus hebetor</i> Muskrat		Rocky Mtn. spotted fever Tularemia	Reservoir	<i>Rickettsia rickettsii</i> <i>Pathococci laemmeli</i>	Man, rabbit, rodent, passerine bird, rabbit	0	0	0

Table 3: Notes, Windmill Point

1. Dermacentor variabilis has been implicated as vector of Rocky Mountain spotted fever in Virginia.
2. The year 1975 was the first time arthropod-borne encephalitis was reported in Virginia. In 1975 there were two cases of eastern equine encephalitis and one St. Louis strain. In 1976 there were three cases of St. Louis encephalitis in and around Richmond. This may represent an emerging zoonosis. The dense populations of passerine birds may require management.
3. Colorado tick fever was previously isolated on the east coast at Long Island, New York.
4. Dermacentor variabilis was confirmed as the cause of tick paralysis in Virginia in 1948.
5. Rocky Mountain spotted fever transmission by Ixodes denatatus was confirmed in Prince George County, Virginia, in 1952.
